

SOFTWARE GROUP PROJECT - 1

Prepared By

Name : Mohit Patel

ID : 20IT102

Class : A2 batch

Subject Teacher : Parth Shah Sir

The background is a dark, textured surface with a complex, interconnected network of light gray lines and dots, resembling a molecular structure or a digital network. The lines and dots are more prominent in the center and fade out towards the edges.

WELCOME TO WEB SECURITY

Here so many ***free web security softwares*** are there
Like ,

- Cerber Security, Antispam & Malware Scan.
- Defendify Cybersecurity Platform
- WOT (Web Of Trust)

If we want to make our own software then required languages are :

- JAVA SCRIPT
- JAVA
- .NET

To create website required languages are :

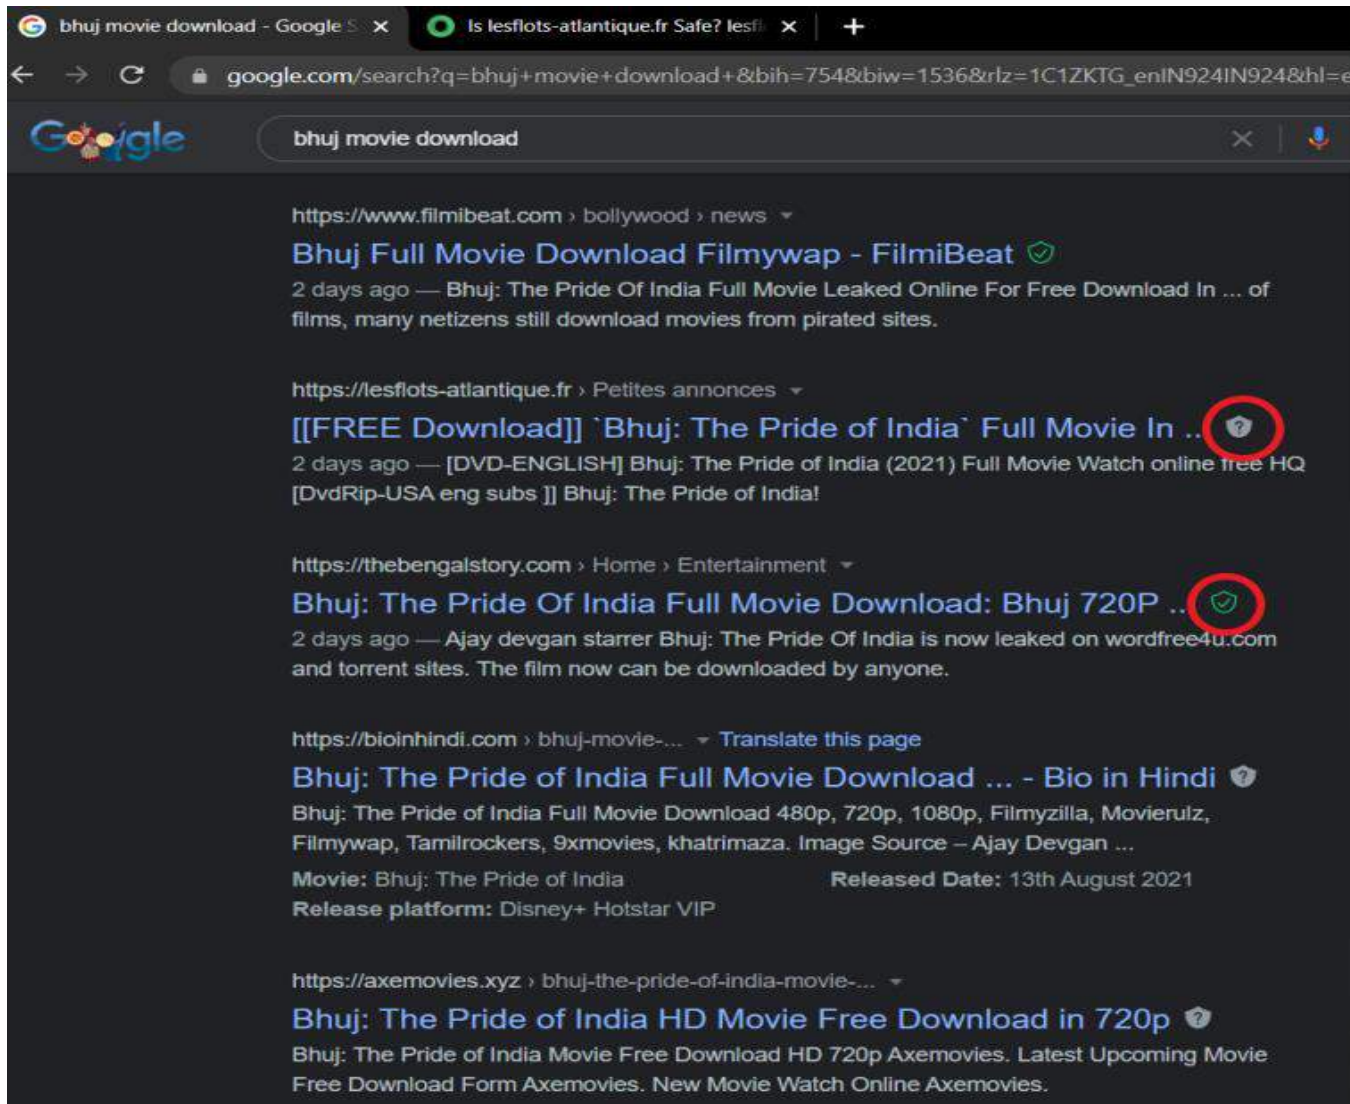

- HTML
- CSS

What is Web Security ?

Web Security means protecting a website or web application by detecting, preventing and responding to cyber threats.

The main benefit of web security is that “a web-security software/website” shows us which website is secure for us ...

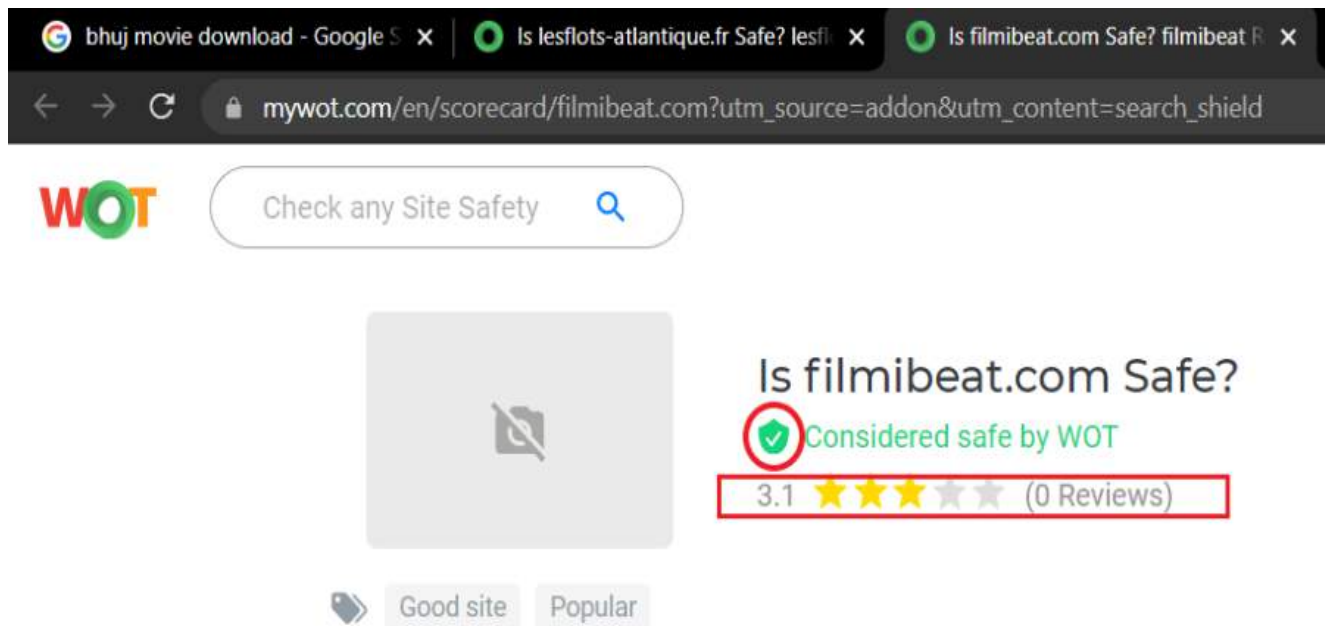

Here this are the indicators which shows
The website is secure or not for us..

- It show a website is not secure or can say not popular.
- It shows a website is secure and also popular.
- It shows a website is unknown means maybe secure or not.

How system is actually work...

1. The confidence level of website is based on user ratings
2. And on third-party malware, scam and spam blacklists.

So, after checking of this two points system will show corresponding indicators..

Here 3.1 ratings are there so system will consider it as secure or good website .
